PLAST-O-MATIC VALVES, INC.

8. Scribe the adjusting screw down to approximately the original position.
   9. Replace the springs, spring housing, and spring. Be careful that the spring housing is

   2. Push the shaft into the body. Use a probe to compress the spring if needed.
   3. Insert the shaft screw and pull the spring down away from the shaft. Reversal to the
   4. Pull the spring down and pull the spring down away from the shaft. Reverse to the
   5. Pull the retaining O-ring over the screw and screw the position to the shaft. Reversal to the
   6. Place the adjusting screw down to approximately the original position.

   1. Turn the adjusting screw in the clockwise direction (the u-shaped side out).
   2. Pull the retaining O-ring over the screw and screw the position to the shaft. Reversal to the
   3. Insert the shaft screw and pull the spring down away from the shaft. Reversal to the
   4. Pull the spring down and pull the spring down away from the shaft. Reverse to the
   5. Pull the retaining O-ring over the screw and screw the position to the shaft. Reversal to the

   2. Push the shaft into the body. Use a probe to compress the spring if needed.
   3. Insert the shaft screw and pull the spring down away from the shaft. Reversal to the
   4. Pull the spring down and pull the spring down away from the shaft. Reverse to the
   5. Pull the retaining O-ring over the screw and screw the position to the shaft. Reversal to the

*IMPORTANT: SEAL MATERIAL MUST BE SPECIFIED (VITON, EPDM OR BUNA-N).

CAUTION! Quick shutoffs of downstream equipment or valves transmits liquid shock waves back to the regulator with the possibility of damaging it. It is best to close valves or equipment gradually to avoid these shocks. If a valve must be closed quickly it is best to do so upstream of the regulator.
